

MOMO TALENTS 2020

Rock Paper Scissors Game

Hoang Thien Nu

Outline

I. Introduction

II. Architecture

III. AI for the game

Introduction

- User enters a name for joining.
- Each user has unique id (maybe same name).

Rock Paper Scissors Game

Enter your name:

Play game

Introduction

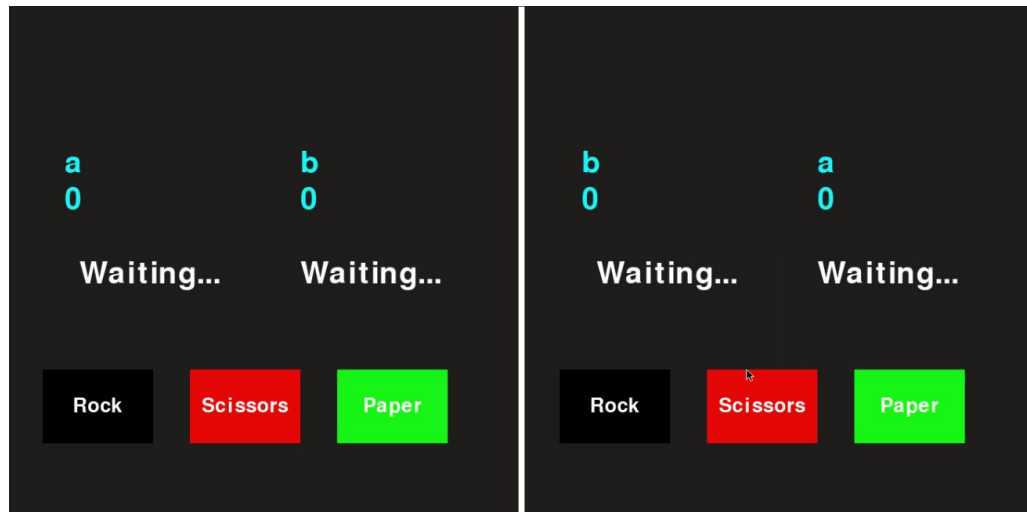

- The game matches 2 free players to start the game.

Waiting for Player...

Introduction

- There are 3 rounds in a game. After 3 rounds, person has higher score wins.
- Each user has at most 20 games.

        self.playerWent = False
    def __str__(self):
        return str(self.id) + ' ' + self.name
```

```
class Game:
    def __init__(self, id, player1, player2 = None):
        self.player1 = player1
        self.player2 = player2
        self.ready = False
        self.id = id
        self.moves = [[], []] #{player1: None, player2: None}
        self.wins = [0,0]
        self.ties = 0
        self.num_players = 1

    #check in server.py
    def addPlayer2(self, player2): ...
    def get_player_move(self, p): ...
    def finished(self): ...
    def get_result(self, p): ...
    def play(self, player, move): ...
    def connected(self): ...
    def bothWent(self): ...
    def winner(self): ...
    def resetWent(self): ...
```

Architecture

Client

- Ask to connect.
- Ask for the game that the client belongs to.
- Wait for user input. And send it to server

Server

- Open a socket and listen for connecting requests.
- When there is a new client, server finds a free user in database for matching. If not, the new game is created.
- Recieve user input and update game state

AI for the game

— — —

- Derived a model from [Data-Science-Community-SRM](#)
- The model was based on transfer learning Inception v3 model. The final trained model resulted in an accuracy of 97.05%.
